Nutritional Supplements for Application via Drinking Water

MODE OF ACTION

The beneficial effects of natural essential oils

Eucalyptus oil is one of the main ingredients of RESFORCE S. It contains a very active beneficial compound called Cineole which has numerous advantages and medicinal applications. In fact it is known for its mucolytic and spasmolytic action on the respiratory tract, with proven clinical efficacy based on its anti-inflammatory and anti-oxidant mode of action. The other important ingredient is Peppermint oil. The main chemical constituents of Peppermint oil are Menthol and Menthone. Menthol is known to be analgesic and is thus beneficial for reducing pain and inflammation; while Menthone is analgesic as well, but on top has also antiseptic activity. Peppermint essential oil has been found to eliminate harmful bacteria and has expectorant properties that clear the respiratory tract and promote the relief from congestion, encouraging easy breathing. It has been demonstrated in addition that Peppermint oil stimulates blood circulation, improves digestion and boosts energy.

The synergistic effect of the other Essential oils improve also the health status of the digestive system, promoting the immune response.

Composition:

1 Lt contains

Eucalyptus oil	15,0%
